ABSTRACT

This report, the second in a series on student financial aid, examines the effects of changes in the design of the Pell Grant Program on applicant eligibility over the 16 years between 1973-74 and 1988-89. The study is an outgrowth of a project undertaken in 1983-84 which attempted to identify the many decisions that constituted the design of each year's Pell Grant Program. The report's three main sections discuss the following topics and subtopics: (1) effects of changes on Pell Grant eligibility (presenting four dependent cases and four independent cases); (2) eligibility design components of the Pell Grant program (classes of eligible applicants, student aid index formula, allowable college costs, and payment schedule); and (3) implications for applicant eligibility (dependent gainers, and independent gainers and losers. It is concluded that, during the 16-year life span of the Pell Grant Program, Congress has shifted the focus of Pell Grants away from lowest resource aid applicants toward applicants from more middle income backgrounds, and this shifting focus will continue in the 1988-89 award year. Applicants whose income and assets produced the highest eligibility for Pell Grants have seen the maximum Pell Grant increase by 50% since 1975-76. During this same time period, the college costs they faced increased about 150%. Pell Grants have lost purchasing power since 1975-76 for six of the eight Pell applicant cases examined in this study. Eighteen figures are included and 19 tables are appended. Contains nine references. (SM)

ABSTRACT

This paper examines the effects of changes in the design of the Pell Grant Program on applicant eligibility over the 16 years between 1973-74 and 1988-89. The primary measure of these effects is the purchasing power of the Pell Grant for financial aid applicants relative to the college attendance costs they face. The eligibility for Pell Grants is determined for representative dependent and independent cases at three kinds of higher educational institutions. This eligibility is compared to the actual college attendance costs faced by students attending these colleges. The paper then identifies the design components of the Pell Grant Program that have been changed in ways that alter applicant eligibility for Grants, and explores their implications.

The paper concludes that during the sixteen year life span of the Pell Grant Program, Congress has shifted the focus of Pell Grants away from lowest resource aid applicants toward applicants from more middle income backgrounds, and that this shifting focus will continue in the 1988-89 award year. Applicants whose income and assets produced the highest eligibility for Pell Grants have seen the maximum Pell Grant increase by 50% since 1975-76. During this same period of time, the college costs they faced increased by about 150%. Pell Grants have lost purchasing power since 1975-76 for six of the eight Pell applicant cases examined in this study. In only one case did applicant eligibility increase.

Other students with discretionary income above amounts protected from assessment toward the family contribution have received new or expanded eligibility as a result of program changes made by Congress. These changes include reduced assessment rates against discretionary income, the addition of an allowance for state and local taxes, and increased multiple student offsets--changes that benefit only higher income applicants with discretionary family resources.

Under the constraint of limited program funding, the enhancements to Pell eligibility for the applicants who gained eligibility have been financed partially but significantly by the loss of Pell Grant purchasing power for those who were the original focus of the Basic Educational Opportunity Grant Program.

ACKNOWLEDGMENTS

This study was an outgrowth of a project undertaken by Shelley Holtman Winking at the Illinois State Scholarship Commission, Springfield, Illinois, in 1983-84. The original project was an attempt to identify the many decisions that constituted the design of each year's Pell Grant Program. Shelley undertook the study as a part of an internship with ISSC, under the supervision of the current author.

The project was revived and extended by the author in 1987-88 as a part of a series of studies examining financial aid in relation to minority student enrollment problems in American higher education. During this study, several individuals provided valuable information and suggestions. Among them were Steve Carter, Policy and Development Office, Office of Student Financial Assistance, U.S. Department of Education; Art Hauptman and Pat Smith, Division of Governmental Relations, American Council on Education; Maureen McLaughlin, Congressional Budget Office; and Mark Heffron and Mike Simpson, Student Needs Analysis Services, The American College Testing Program. The final paper was greatly improved by their commentary. Its deficiencies are, however, the responsibility of the author.

**PELL GRANT PROGRAM CHANGES
AND THEIR EFFECTS ON APPLICANT ELIGIBILITY
1973-74 TO 1988-89**

By Thomas G. Mortenson

Introduction

Purposes of Paper

Since the beginning of the Pell Grant Program in 1973-74, appropriations provided for grants to applicants have increased nearly every year. But so has the number of applicants, and so too have the college costs that they have faced. The financial need presented by applicants has grown faster than appropriations. As a result, the Pell Grants available to most classes of applicants have lost purchasing power since 1975-76 compared to the college attendance costs they are intended to help finance.

This loss in purchasing power of Pell Grants results directly from faster growth in the financial need of applicants than growth in dollars provided by Congress. Program funding need is the product of application volume and the need presented on each application. That need - the difference between college attendance costs and the resources available to applicants - is multiplied by the combined effects of college attendance costs increasing faster than inflation and the growth in low income Pell applicants, particularly older, independent students. These demands on Pell Program resources are largely determined by economic forces beyond the influence or control of Congress.

One additional factor in the only partially funded growth in need of Pell Grant applicants is under the direct control of Congress and is the focus of this paper. That is the expanded eligibility for Pell Grants for individuals from incomes above the poverty level. Congress has extended Pell Grant eligibility through program changes enacted primarily in the Middle Income Student Assistance Act in 1978 and the Education Amendments of 1986. Thus, in addition to only partially funded growth in external demands on Pell Grant Program resources, Congress has added unfunded demands of its own to make more students more eligible for limited Program funds. Congress, through deliberate action, has shifted resources for increases in the maximum grant available to the lowest income Pell Grant applicants to others from higher income levels.

This loss of purchasing power for the foundation of all student aid programs has implications for the equity of higher educational opportunity goals of need-based student aid. Lowest income applicants--those judged unable to contribute toward the financing of their college costs--must turn to other forms of financial aid such as loans or employment to pay college expenses. Each alternative imposes current or future obligations on the applicant that grants such as Pell do not. To some degree, there are enrollment consequences from this shift.

The Pell Grant Program, therefore, remains the first and most important aid program for low income financial aid applicants.

Pell Grant Program Background

The federal Basic Educational Opportunity Grant Program was designed by Congress in the early 1970s to be the floor of the eligible student's financial aid package to help defray the costs of postsecondary education (Gladieux and Wolanin, 1976). Today the Program--now called the Pell Grant Program--remains largely true to that concept of its original mission. However, changes to the Program have been made by Congress during subsequent legislative reauthorizations (Hartle and Stedman, 1986). These changes have altered both student eligibility for the Grants as well as the purchasing power of the Grants relative to the college costs applicants face. The eligibility for Pell Grant aid of some groups of students has been increased by these changes, while for others eligibility has been reduced or eliminated.

This paper examines the effect of changes made in the design components of the Pell Grant Program on applicant eligibility since the Program's first year of operation in 1973-74. These changes were made primarily in the 1978 Middle Income Student Assistance Act and the 1986 Education Amendments to the Higher Education Act of 1965. The four Program design components examined in this paper are: classes of eligible applicants, the formulas used to determine family contribution, college costs allowed, and the payment schedule.

The net effect of these Program design components on applicants is illustrated by calculating full-time Pell Grant eligibility for four dependent and four independent cases that remain constant over time. That is, income is expressed in constant dollars and family circumstances are fixed for the period from 1973-74 through 1988-89. Grants are calculated for these eight cases under three enrollment situations: an average cost public two-year college where the student lives off campus, and average cost public and private four-year colleges where the student lives on campus.

The net effect of Program design changes on Grant applicant eligibility over time may be measured in many ways: 1) the expected family contribution (SEI/SAI), 2) the expected family contribution effort (SAI as a percent of income), 3) the amount of the Pell Grant for which the applicant is eligible, 4) the proportion of college budgets covered by the Pell Grant, 5) the amount and proportion of need met by the Pell Grant plus the expected family contribution, 6) the amount and proportion of unmet need remaining after the family contribution and Pell Grant are deducted from these college attendance costs, and 7) by the amount of unmet need expressed as a percent of family income. This paper illustrates Pell Grant purchasing power as a proportion of actual college attendance costs. Additional descriptive measures are provided in appendix tables.

The federal Higher Education Act of 1965 inaugurated the federal commitment to needs-tested grant aid for college students with the Educational Opportunity Grant Program (EOG). This Program was modified and renamed the Supplemental Educational Opportunity Grant Program (SEOG) with the 1972 Amendments to the Higher Education Act. More importantly, Congress at that time created the Basic Educational Opportunity Grant Program (BEOG)--which, since 1980, has been called the Pell Grant Program--with a specific focus on grants directed to low income populations. The original Higher Education Act has been modified substantially and repeatedly since 1965, most notably regarding the Pell Grant Program in 1972, 1978 and 1986.

The focus of BEOG/Pell was the provision of grants to students from lower family incomes based on the demonstrated financial need of applicants to pay college attendance costs. Periodically, Congress has extended Pell Grant eligibility to additional students by changing Program design components. These extensions have primarily benefited applicants with discretionary income beyond the amount protected by family size offsets within the formula.

Table 1 summarizes the scale of the Program since its inception. Between 1973-75 and 1986-87, approximately 57 million applications were submitted to the Pell Grant Program for assistance. Thirty million Grants from these applications have been made, at a total cost of \$28 billion. Currently, about one out of every five undergraduate students enrolled in public and private colleges in the U. S. is receiving a Pell Grant to help finance college attendance costs.

Note in Table 1 the changing proportion of official (unduplicated) applications that eventually become Pell Grant recipients. Changes in this proportion reflect both changing applicant characteristics and changes in the treatment of their applications under changing laws and rules governing the Pell Grant Program. Table A-1 in the Appendix provides more detail for this table.

Effects of Changes on Pell Grant Eligibility

To illustrate the effects of changes in the four areas of Program design on applicant eligibility, four dependent and four independent cases that are representative of applicant situations have been selected. Their respective Pell Grants were calculated at off-campus average cost public two-year, on-campus public four-year and on-campus private four-year colleges for each year 1973-74 through 1988-89. Note that for each case, applicant circumstances do not change. Therefore, changes in Pell Grant eligibility over time are the result of changes in Program design and changes in the college costs that Pell Grants are designed to address.

Dependent Cases

The four dependent cases selected for testing are the following:

- Case D1: Pell applicant from a family of four, one wage earner, one in college, family income at poverty level, and no assessable assets.
- Case D2: Pell applicant from a family of four, one wage earner, one in college, family income at the Bureau of Labor Statistics lower budget level for a family of four, and no assessable assets.
- Case D3: Pell applicant from a family of four, one wage earner, one in college, family income at the BLS intermediate budget level, and no assessable assets.
- Case D4: Pell applicant from a family of four, one wage earner, two in college, family income at the BLS intermediate budget level, and no assessable assets.

The Pell Grants received by dependent applicants in the above cases are presented in Table 2.

Source: Appendix Table A-7.

Figures 1 through 4 on the following pages illustrate the proportion of actual college attendance costs covered by the Pell Grants available to applicants in the four cases at each of the three types of colleges the applicant might attend. The actual college attendance costs used in this study are shown in Appendix Table A-2 and are based on national average tuition and fee and room and board data collected by the U.S. Department of Education, and other direct and indirect college attendance cost data collected through surveys by the California Student Aid Commission. (A future ACT Financial Aid Research Report will provide more of this data for the purpose of constructing College Attendance Price Indices.)

Figure 1 represents the purchasing power of the Pell Grant available to a dependent applicant from poverty level family income. After the first two years of start up of the original Basic Educational Opportunity Grant Program in 1973-74 and 1974-75, a fully funded Pell payment schedule was achieved in 1975-76 (although only freshmen, sophomores and juniors were eligible for Grants that year). Since 1975-76, the purchasing power of the Grant compared to actual college attendance costs has decreased. At a public four-year college, Grants that covered 36% of college costs in 1975-76 dropped to about 31% by 1988-89. The available Grant went from 31% of college costs at a public two-year college in 1975-76 to about 25% by 1988-89. If the student

had faced attendance costs at a private four-year college, the purchasing power of the Grant would have dropped from 30% to 17% during this time period.

Figure 2 shows the purchasing power of the Pell Grant for a student from a Bureau of Labor Statistics (BLS) lower level family income level. Here again the available Grant has lost purchasing power relative to college costs. The proportion of college budgets covered by Pell dropped from about 28% to 22% in public two-year colleges between 1975-76 and 1988-89, from 27% to 22% in public four-year, and from 17% to 12% in private four-year colleges.

Figure 3 shows the purchasing power of the Pell Grant for a student from a BLS intermediate budget level family income with one family member enrolled in college. Here the applicant would have been eligible for a Pell Grant only during the three year period of the Middle Income Student Assistance Act, beginning with 1979-80. For this relatively brief period, the applicant qualified for a Pell Grant at all three institutional types, for amounts that covered as much as 22% of actual college attendance costs. Since 1982-83, however, applicants for Grant assistance have not qualified for aid.

Figure 4 shows the purchasing power of a Pell Grant for an applicant from a BLS intermediate family income with two children from the same family enrolled in college at the same time. In this case, eligibility was for Grant assistance that fluctuated substantially over the life of the Program. Eligibility peaked during the MISAA years of 1978-79 through 1980-81, and will rise again in 1988-89.

Independent Cases

The four independent cases selected for testing are the following:

- Case I1: Pell applicant who is single, with income at 50% of the poverty level, no assets.
- Case I2: Pell applicant who is single, with income at 100% of the poverty level, no assets.
- Case I3: Pell applicant who is single, with one dependent, with unearned income at 100% of poverty level, no assets.
- Case I4: Pell applicant who is married, with income at 150% of poverty level, one in college and no assets.

When Pell applicant eligibility is calculated for these four cases at the three types of colleges used in the previous, dependent case examination, the applicants would be eligible for the following Grant amounts.

Source: Appendix Table A-12.

Table 3 shows gains and losses in eligibility for independent Pell applicants over the life of the Program. Single independents with incomes at the federal poverty level have gained eligibility, especially since 1979-80. On the other hand, married independent Pell applicants with incomes at 150% of the poverty level where only one member is in college will lose all of their Pell eligibility in 1988-89.

The charts on the following pages illustrate changing Pell applicant eligibility, and met and unmet need for the four cases since 1973-74.

Eligibility Design Components of the Pell Grant Program

The original federal objective of the Pell Grant Program was to assist low income aid applicants to finance their higher educational attendance costs through the provision of a grant. The federal policy has been clear and consistent that Pell alone would not cover all college attendance costs - only as much as about half of the attendance costs recognized in the Program - but Pell Grants would be the first source of aid in financing college costs. With this Grant as the floor of the applicant's aid package, other financial aid from other federal, state and institutional sources would be used to complete the financing of the student's direct and indirect college attendance costs.

To fulfill the above role, the Pell Grant Program consists of Program design elements that determine applicant eligibility for the Grant. These design elements are: 1) specified classes of eligible applicants, 2) Student Aid Index formula, 3) allowable college costs, and 4) the payment schedule. Each of these is described below.

Classes of Eligible Applicants

Since the beginning of the Program, applicants for aid have been required to meet specified criteria in order to be eligible for consideration of a Pell Grant. During the first year of the Program in 1973-74, this list consisted of just three eligibility criteria: the applicant had to have begun studies after July 1, 1973 (thereby limiting eligibility to freshmen), be enrolled full-time and at an eligible institution. Gradually, this list has been expanded to address additional federal concerns and now includes over a dozen applicant eligibility criteria.

Table 4 on the following page summarizes the classes of Pell applicants that are eligible for consideration. In many respects, eligibility has been greatly expanded since the Program's first year: freshmen eligibility in 1973-74 was expanded to include all undergraduates by 1976-77, and full-time enrollment was replaced by half-time enrollment in 1975-76; this, in turn, could be replaced by less than half-time enrollment as early as 1989-90.

In other respects, applicant eligibility has been restricted in ways that address specific Congressional concerns. For example, in 1983-84 Congress implemented the requirement that students make satisfactory academic progress towards completion of their programs of study while receiving Pell Grants. Congress has also established applicant eligibility standards that eliminate applicant eligibility for those who have defaulted on a federal student loan, who owe refunds on prior Pell or SEOG Grants, or for males who have not registered with the Selective Service. As Congress chooses to address other issues in the public policy arena, additional changes can be expected in applicant eligibility criteria in the future.

Student Aid Index Formula

Pell applicant eligibility is carefully examined through formulas adopted to assess applicant and family ability to finance college attendance costs from their own resources. At this stage, formulas requiring detailed family information reflect Congressional judgments concerning what families need to

provide for themselves, and, of the remainder, what is to be expected from the Pell applicant (and his or her family) toward financing college attendance costs. The result is a financial expectation from family resources originally called Student Eligibility Index (SEI), and in 1982-83 renamed the Student Aid Index (SAI). While this number appears as a pure index value, the Pell Program derives this as a dollar amount. Separate formulas are used for dependent and independent Pell applicants. The phases of this determination are outlined briefly below.

Dependent/independent student status: Table 5 summarizes the changing definitions of dependency used in the Pell Grant Program since its inception. Basically, Congress has looked at three criteria to determine student status: Has applicant been claimed as an exemption on the parent's federal tax return? Has the applicant received more than a specified sum of cash or in kind from parents? Has the applicant lived in the home of the parent? Changes were made in these criteria in 1979-80 (MISAA), and further changes contained in the 1986 Amendments became effective in 1987-88.

Dependent SAI formula: The Pell formula's analysis of the dependent applicant and his/her family's ability to finance college attendance costs follows commonly used methods of ability to pay models, of which income tax models are a familiar example. However, assets also enter into this analysis, as do other factors relevant to college attendance. The general dependent Pell model is clearly spelled out in Pell work sheets:

Family income:	Parent's income + Married couple working deduction + Parent's social security benefits + Parent's AFDC + Parent's other income and benefits + 1/2 Student's Veteran's benefits - Parent's federal income taxes - Family size offset - Employment expense offset - Elementary/secondary tuition = Parent's discretionary income x Assessment rates = Contribution from family income
Parent's assets:	Net value of parents' assets - Asset reserve + Parents' other net assets - Asset reserve x Assessment rate = Contribution from parents' assets
Parental contribution:	Contribution from family income + Contribution from parents' assets x Multiple student adjustment = Total parental contribution
Student's assets	Net value of assets x Assessment rate = Contribution from student assets
Student's income	Student's taxable income - Federal income taxes paid + Student's untaxed income and benefits - Dependent student offset x Assessment rate = Contribution from student income
Student Aid Index	Total parental contribution + Contribution from student assets + Contribution from student income = Student Aid Index

For the purpose of the analysis of effects of changing Pell Grant Program design attributes on applicant eligibility, parent and student variable inputs are held constant in this study. Therefore, changes in observed applicant

*Approximate.

eligibility were the result of changes in either Program design components (here SAI formula components) or the college attendance costs faced by the Pell applicant.

Table 6 summarizes the major changes in the Pell SAI formula that occurred between 1973-74 and 1988-89. These include the change in the family size offset calculation in 1979-80 and the freezing of that allowance in 1981-82, and the inclusion of the state tax allowance and the change in the multiple student offset in 1988-89.

However, the greatest change in the dependent Pell SAI formula has been in the rates at which discretionary parental income has been assessed to finance college costs. During the first six years of Pell, this rate expected parents to contribute 20% of the first \$5000 and 30% of all discretionary income above \$5000 toward the college costs of their children. In 1979-80, as a result of the Middle Income Student Assistance Act (MISAA), this rate was dropped to 10.5% for all discretionary income. Three years later, progressivity was partially restored to these rates. The assessment rates that became effective in 1982-83 were 11% on the first \$5000 of discretionary parental income, 13% on the next \$5000, 18% on the third \$5000, and 25% on all discretionary income above \$15,000. These rates are well below the rates that existed before MISAA, but above the MISAA-era rates.

Independent SAI formula: While the structure of the Pell dependent formula has been relatively stable over the life of the Program, the structure of the independent formula has not. This independent formula instability is a result of continuing attempts by Congress to design a method of fairly determining an expectation of contribution from independent applicant resources that accommodates a wide variety of independent circumstances. These circumstances include single with and without dependents, married with and without dependents and number enrolled in college one or more than one, and presence or absence of business or farm assets. The continuing attempts to address this issue through redefinition of independent status and changes to assessment rates against discretionary income reflect the difficulties and unresolved problems independent student status presents to Congress.

The simplest independent applicant case is the single student. The 1987-88 structure of the Pell SAI formula for this case is the following:

Student income:	Income
	+ Social Security benefits
	+ Other untaxed income
	+ 1/2 Veteran's educational benefits
	- Federal Income taxes
	- Family size offset
	- Unusual medical expenses
	x Assessment rate
	= Contribution from student income
Student assets:	Net assets
	x Assessment rate
	= Contribution from student assets
Student Aid Index	Contribution from student income
	+ Contribution from student assets
	= Student Aid Index (SAI)

For family sizes greater than one, the Pell independent SAI formula adds steps, such as the multiple student adjustment, and uses assessment rates against income and assets that are lower than for a single student. The general structure of the preceding formula, however, remains similar.

Of particular importance to single independent applicants are the family size offset and assessment rates against discretionary income. Until 1979-80, the family size offset for a family size of one was less than half the federal poverty level. This meant that many single Pell applicants living below the poverty line were unable to qualify for maximum Pell Grants. When the family size offset for a single independent student was increased to the poverty level in 1979-80, SAIs for these students dropped sharply and their resulting Pell Grant eligibility increased.

Also, of particular importance to independent Pell Grant applicants with family size greater than one have been the shifts in assessment rates against discretionary independent family income. Married independent discretionary family income was assessed at 50% from 1973-74 through 1980-81, when it was dropped to 25%. For 1988-89, this will be increased to 75%, making many previously eligible applicants no longer eligible for Pell Grant aid.

For independent families with dependents other than a spouse, the assessment rate has been steadily lowered, from 40% for the first seven years of the Pell Grant Program, to 25% for 1980-81 through 1987-88, to a progressive rate beginning at 11% for 1988-89. These changes, of course, greatly expand applicant eligibility for independents from these circumstances.

Allowable College Costs

The Pell Grant Program allows for the consideration of certain direct and indirect college attendance costs, namely tuition and fees, room and board or an alternative living allowance, and books, supplies and miscellaneous. The allowance for these components will be discussed in more detail shortly.

The Pell Program does not allow for opportunity costs of college attendance. Opportunity costs are frequently recognized in the Pell SAI formula as being present. For example, negative numbers may be calculated when determining expected contribution from parental income, residential assets, other net assets, and at other places in the dependent SAI formula. However, negative numbers are usually increased to zero when they appear in the formula, thus effectively eliminating the consideration of opportunity costs of college attendance for those from lowest income families.

The direct and indirect college attendance costs that Pell does recognize are discussed separately below.

Tuition and fees: Pell considers the actual tuition and fees faced by the applicant for aid to attend college. This is simple and direct.

Books and miscellaneous allowance: The Pell budget allows \$400 for books and miscellaneous expenses of college attendance. The same number has been used for all Pell applicant college budgets since the inception of the Program in 1973-74 through 1987-88.

Living allowance: Pell college budgets between 1973-74 and 1987-88 allowed for three living arrangements: home, off campus, and on campus. The campus room and board rate was included in the college budget if the student lived on campus. An allowance for up to \$1,600 was made if the student lived off campus, but not at home. An allowance of \$1,100 was made for the student who lived at home.

Beginning in 1988-89, the living allowance and the books and supplies allowance will be combined into a single maintenance allowance. This will be \$2,200 for all applicants living on or off campus, and \$1,600 for those living at home.

Several aspects of this allowance are relevant to the consideration of Pell Grant coverage of actual college attendance costs. First, an allowance for maintenance of the student is also included in the family size offset against family income. Thus, the Pell Grant living allowance may be viewed as an allowance for the marginal living costs associated with college attendance. For the student living at home, the \$1,100 allowance may properly be viewed as addressing commuting costs and food away from home.

This sum, however, has remained constant at \$1,100 over the sixteen year history of the Program, from 1973-74 through 1987-88, when other prices in the economy (CPI) have increased by 166%. For the student living off campus, this allowance was increased from \$1,100 to \$1,600 in 1984-85, a 45% increase. Table 7 on the following page summarizes the major dimensions of the allowable cost components of the Pell college budget since 1973-74.

The difference between the Pell allowable college costs and the actual college attendance costs faced by students in the three college/housing settings used in this study is examined in more detail in Table 8. The estimated average college attendance costs actually faced by students includes the direct costs of tuition and fees, and books and supplies. The indirect costs included are average reported costs for food and housing, transportation, and other personal and miscellaneous living costs for nine months. The Pell allowable college costs include not only tuition and fees, living allowance, and books and miscellaneous allowances, but also nine months of marginal maintenance allowance in the family unit.

The results of this comparison show that, in all cases, Pell allowable college costs have not increased as fast as have the actual college attendance costs faced by students. For students living in campus dormitories at a public four-year college, Pell allowances that covered 96% of actual costs in 1973-74 covered 86% by 1987-88, and will probably cover about 59% in 1988-89. The decline was somewhat less for a student at a private four-year college - from 98% to 92% between 1973-74 and 1987-88, to about 77% in 1988-89. However, for a student living off campus at a public two-year college, the Pell allowance that covered 81% of actual college attendance costs in 1973-74 covered just 56% by 1987-88, despite the increase in the off campus living allowance from \$1,100 to \$1,600 in 1984-85. (Note that different assumptions about dependency will alter this comparison substantially.)

Payment Schedule

The final design component of each year's Pell Grant Program is the Pell Grant payment schedule. This table brings together each applicant's Student Aid Index and allowable college costs to determine the dollar amount of the Pell Grant for which the student has applied.

This table is often released quite late, six months or more after all other components of the Program have been decided and announced. The payment schedule represents the final opportunity for Congress and the Department of Education to resolve any differences that may exist between the anticipated cost of the program and the resources available to fund student Pell Grants. In this sense, the Pell Grant payment schedule is an important rationing device to balance revenues with anticipated expenditures. Rationing may occur in any of several ways, including the maximum grant amount, the maximum qualifying SAI, and/or the amount of the minimum grant.

The payment schedule is normally determined through a relatively straightforward process of calculation constrained by such factors as maximum and minimum allowable college costs, proportion of allowable costs to be covered by the Pell Grant, and the maximum Grant amount set by Congress as funding is reviewed. When available funding is inadequate, the payment schedule may be reduced in a variety of ways or as in the past, funds may be borrowed from future Pell appropriations to pay current Program obligations.

Table 9 summarizes the major design components of the Pell Grant payment schedule since 1973-74. The many variables available to design Pell eligibility are apparent here.

Table 9

Pell Grant Full-Time Payment Schedule Summary

Implications for Applicant Eligibility

The original intent of Congress--to make substantial grant assistance available to students on the basis of financial need--remains intact today. However, Congress expanded its original definition of financial need with the Middle Income Student Assistance Act in 1978, and continues to expand this conception of middle income financial need with the 1986 Amendments to the Pell Grant Program.

Under budgetary limitations, the expansion of eligibility to new groups of students and increase in eligibility to some previously eligible students has occurred at the expense of lowest income aid applicants. As a result, the Pell Grant has lost purchasing power relative to the costs of attendance faced by lowest SAI Pell Grant applicants eligible since 1975-76.

Who gains and who loses under the changes in applicant eligibility made by Congress in the 1978 and 1986 amendments? Due to the different formulas employed, any effort to identify those who have gained and those who have lost Pell Grant eligibility requires that dependent and independent applicants be considered separately.

Dependent Gainers

Factors affecting eligibility: Changes made by Congress to dependent applicant eligibility for Pell Grants have quite consistently expanded eligibility for dependent applicants. These changes were largely made in the 1978 Middle Income Student Assistance Act, effective in 1979-80, and the 1986 Amendments, effective in 1988-89. Three changes are most important to the extension of Pell eligibility to dependent applicants from middle income backgrounds:

1. Reduced assessment rates against discretionary income (1979-80)
2. Allowance for state and other taxes (1988-89)
3. Reduced multiple student offset (1988-89)

The reduction in the assessment rate against discretionary income was the first and remains the most important effort by Congress to extend Pell eligibility to middle income aid applicants. The assessment rate against discretionary income was 20% on the first \$5,000 and 30% on all discretionary income above \$5,000 from 1973-74 through 1978-79. Beginning in 1979-80, these rates were reduced to 10.5% on all discretionary income, through the Middle Income Student Assistance Act. For 1982-83, these rates were increased slightly to 11% of the first \$5,000 of discretionary income, 13% on the next \$5,000, 18% on the next \$5,000, and 25% on all discretionary income over \$15,000. Despite their modification for 1982-83, these rates are well below the original assessment rates against discretionary income.

The effects of these three rate systems on the proportion of discretionary income taken for the SAI is illustrated in Figure 9. The net effect was and clearly remains to reduce the expected contribution from family income toward the SAI. This reduction in expected family contribution expands applicant eligibility for Pell Grants, but only for those with discretionary

FIGURE 9

PELL GRANT DEPENDENT APPLICANT
AMOUNT EXPECTED FROM DISCRETIONARY PARENTAL INCOME
DURING THREE PERIODS
1973-74 TO 1988-89

family income, and more for those with more discretionary family income. Applicants whose incomes fall below the family size offset--the poorest among Pell applicants--receive no benefit from this reduction in assessment rates against discretionary income because they do not have any.

The allowance for state and other taxes in the 1986 Amendments is effective in 1988-89. The allowance varies from state to state, but averages about 8% across all states. This allowance reduces the amount of discretionary family income assessable toward the family's SAI. The more discretionary family income there is, the greater is the benefit to dependent applicants. Applicants whose incomes fall at or below the family size offset--the poorest among Pell applicants--receive no benefit from this allowance.

The multiple student offset is another allowance that reduces the family's expected contribution toward meeting college costs when more than one family member is enrolled in college at the same time. Between 1973-74 and 1987-88, the multiple student offset was 70% when two family members were enrolled in college at the same time, 50% when three were enrolled, and 40% when four or more were enrolled. The 1986 Amendments reduced these rates to 50%, 33% and 25%, respectively. This reduction is a substantial benefit for families with several members enrolled concurrently and SAIs greater than zero. Applicants whose incomes fall below the family size offset--the poorest among Pell applicants--receive no benefit from this offset.

The effects of the above changes in the Pell Grant Program on applicant eligibility for Grants can be illustrated in a variety of ways. Three are shown here.

Maximum income cutoffs: Figure 10 illustrates the maximum family income at which an applicant qualifies for the minimum Pell Grant under pre-MISAA and post-MISAA SAI formulas. (This case is a family of four, one in college, with no assets. Other family sizes and circumstances will alter the positions of these curves.)

Except for the 1986-87 award year when a funding shortfall forced a reduction in the Pell payment schedule, the expanded middle income eligibility for Pell Grants initiated with MISAA in 1979-80 has been preserved through 1987-88 and further expanded in 1988-89. For 1988-89, the example of a family used here could qualify for the minimum (\$200) Pell Grant up to an income of \$28,600. Under pre-MISAA SAI formulas, with higher assessment rates against discretionary income and no allowance for state taxes, only families with incomes up to \$23,200 would have qualified for the minimum \$200 Grant.

In addition to this higher income limit for the minimum Pell Grant, all applicants eligible to receive Grants less than the maximum grant qualify to receive larger grants under post-MISAA SAI formulas than they would have under pre-MISAA SAI formulas. For example, the family with \$23,200 in income that would have qualified only for a \$200 Pell Grant in 1988-89 under the original Pell formula actually qualifies for a Grant of \$1,150 because of the state and local tax allowance and the lower assessment rates against discretionary income.

FIGURE 10

MAXIMUM QUALIFYING FAMILY INCOME FOR A MINIMUM PELL GRANT
UNDER PRE-MISAA AND POST-MISAA PELL SAI FORMULA
1973-74 TO 1988-89

Family size = 4, 1 in college, no assets

Alternative formula simulations: A second illustration of the effect of liberalized Pell eligibility is possible through use of the ACT Simulation Service, a part of ACT's Student Need Analysis Service. This simulation is used here to identify the family income levels that benefited from the liberalized dependent Pell eligibility criteria and to show the magnitude of the increased program costs that resulted from these changes.

Using a random sample of about 12,000 dependent Pell applicants for 1987-88 and two sets of dependent eligibility criteria--original Pell Program and 1988-89 Pell Program--Table 10 and the following figure summarize what happened. The proportion of applicants eligible under original Program criteria was 34.1%. After liberalization, 54.5% of this same applicant population became eligible.

This increase of about 20% in Pell applicant eligibility, however, was not spread evenly across income levels. As shown in the figure, the proportion of applicants that gained eligibility from total parental income levels below \$12,000 per year was less than 4%, while the gain was over 50% for those from income levels of \$18,000 to \$24,000 per year, and 46% for applicants from families with incomes of between \$24,000 and \$30,000 per year. Even at family incomes of \$42,000 to \$48,000 per year, the gain in applicant eligibility was greater than it was for those from family incomes of less than \$12,000 per year.

The costs added to the Pell Grant Program were similarly concentrated in middle family income ranges. (In 1985, median family income in the U. S. was \$27,735 according to the Census Bureau.) Only 9.5% of the increased program costs went to dependent Pell applicants from family incomes below \$12,000 per year. Over half of the increased Program costs went to applicants from families with incomes between \$18,000 and \$30,000. About 15% of the additional program costs were incurred by adding applicant eligibility from family income levels above \$30,000 per year.

Effects of 1986 Amendments: The expansion of middle income eligibility for Pell Grants initiated with MISAA in 1978 was continued through the 1986 Amendments. The two principal devices used to assist middle income dependent applicants were the allowance for state and local taxes, and the increase in the multiple student offset. The figures on pages 34 and 35 show the effects of these changes on applicant grant eligibility at a public four year college at different income levels between 1987-88 and 1988-89 for two representative dependent cases.

In the case of a dependent from a family of four with one in college, the Pell Grant for which the applicant was eligible increased by \$90 between 1987-88 and 1988-89 for those from family incomes of \$10,000 per year or less. The Pell Grant increased by \$200 for applicants from family incomes of between \$14,000 and \$26,000 per year. At \$28,000 per year, the Pell Grant increased by \$250.

In the similar dependent case, but where two family members were in college, the Pell Grant increased by \$90 at a public university for those from incomes below \$8,000 per year, by \$200 at \$15,000 per year, by \$500 at \$24,000 per year, and by \$850 at \$32,000 per year. The pattern is clear: the smallest gains in Pell Grant eligibility went to those from lowest incomes, while the largest gains went to those from much higher income levels.

AT A PUBLIC FOUR-YEAR COLLEGE

FIGURE 13

CHANGE IN PELL GRANT BETWEEN 1987-88 AND 1988-89
FOR A DEPENDENT APPLICANT, FAMILY OF FOUR, TWO IN COLLEGE
AT A PUBLIC FOUR-YEAR COLLEGE

The Pell Grant maximum award--for those with zero SAIs and therefore without apparent personal means to finance their college attendance costs--has lost purchasing power almost steadily over the life of the Program. For example, a maximum Pell Grant that covered 50% of the costs of attending a public two-year college in 1975-76 now covers 31% of these costs. At a public four-year college the Pell maximum that covered 44% of college attendance costs in 1975-76 now covers 31%. At a private four-year college, the maximum Pell Grant that covered 30% of costs in 1975-76 now covers about 17% of such costs. While the Pell Grant maximum--which only lowest income aid applicants may qualify for--has increased by 50% between 1975-76 and 1987-88, college attendance costs faced by such applicants have increased by 140% to 167%.

The accumulated preceding evidence appears to warrant the following conclusion: In the case of dependent Pell applicants with lowest SAIs, some significant portion of the funds required to maintain the purchasing power of the Pell Grant relative to actual college attendance costs has been reallocated by Congress, first in 1978 and again in 1986, toward applicants with higher SAIs to increase their Pell eligibility.

Independent Gainers and Losers

Congress has made several changes in the standards used to determine eligibility for Pell Grants for independent applicants as well. Because the single term "independent" encompasses many different circumstances, different cases are used here.

Factors affecting eligibility: Generally the changes made to Pell Grant eligibility that have benefited middle income dependent applicants have also benefited independent applicants. These include reductions in assessment rates against discretionary income, allowances for state and local taxes, and multiple student offsets. However, other changes made by Congress have also benefited and sometimes reduced or eliminated independent Pell Grant applicant eligibility since 1973-74. These major changes made by Congress are:

1. Increased family size offset for single independents in 1979-80
2. Change in assessment rate against discretionary income for a married independent applicant without children, first a reduction in 1980-81 and then an increase in 1988-89
3. Reductions in assessment rates for independent applicants with dependents other than spouse first in 1980-81, and again for 1988-89

Single independent financial aid applicants make up about half of the ACT Family Financial Statement independent filing population. Between 1973-74 and 1978-79, the family size offset for the single independent case was about 35% of the federal poverty level. For family sizes greater than one, the family size offset was set at the federal poverty level. In 1979-80, the allowance for single independents was increased to approximately the poverty level, thus protecting income to this higher level from any assessment toward the applicant's SAI.

For married independent Pell applicants without dependents, Congress has changed the assessment rate against discretionary family income twice. The first time, in 1980-81, the rate was reduced from 50% to 25%. Then Congress reversed itself and increased this rate to 75% effective with the 1988-89

academic year. This increase will reduce or eliminate the eligibility of these applicants who have incomes above the family size offset.

Independent applicants with dependents other than spouse have received the benefit of two reductions in the assessment rate against their discretionary family incomes. The original rate of 40% was first reduced to 25% in 1980-81, and then to a progressive rate schedule beginning at 11% for 1988-89. For grant applicants with incomes above the family size offset, these changes have and will increase Pell eligibility substantially.

Alternative formula simulations: The combined effects of these changes plus state and local tax allowances and multiple student offsets on independent Pell applicant eligibility are shown in Table 11. Using the ACT Simulation Service again, two Pell SAI formulas were tested against a random sample of 6,640 1987-88 ACT Family Financial Statement filers. One simulation used the formula to be employed in 1988-89, and the other employed formula criteria that were used during the first five years of the Pell Grant Program. The differences in formulas may be summarized as follows:

	<u>Original Program</u>	<u>1988-89 Program</u>
Family Size Offset:		
Family size is one	\$1,800	\$5,300
Tax allowances:	federal	federal & state
Discretionary income assessment rates:		
Married with spouse	50%	75%
With dependents	40%	\$1-\$5K: 11%
		\$5K-\$10K: \$550+13%
		\$10K-\$15K: \$1,200+18%
		\$15K+: \$2,100+25%
Multiple student offset:	100/70/50/40	100/50/33/25

A bimodal distribution of beneficiaries under these changes results. The largest increase in eligibility for Pell Grants occur in the total student income intervals of \$3,000 to \$9,000 and \$15,000 to \$30,000. The largest gain in additional dollars--an increase of 63%--occurred in the \$3,000 to \$9,000 income range. Again, the lowest income Pell applicants were not the primary beneficiaries of the liberalization in Pell eligibility that occurred after the first six years of the Program.

Effects of 1986 Amendments by income level: Four independent student cases were studied to determine the effects of the 1986 Amendments on Pell applicant eligibility changes between 1987-88 and 1988-89. To assist in the focus of the discussion, changes in Pell eligibility at only a public four-year college are reported here. More results for other kinds of institutions are included in the appendix to this paper.

For a single independent applicant at an income of less than \$4,000, the Pell Grant will increase by \$90 between 1987-88 and 1988-89. At \$6,000 of income, the Pell Grant will increase by \$200. At \$7,000 and \$8,000 of income, the Pell Grant will increase by \$300.

Original Pell Program: federal tax allowance, 100/70/50/40 multiple student offset, \$1800 single student family size offset, and DI rates of 50% for married and 40% if dependents other than spouse.

1988-89 Pell Program: federal and state tax allowance, 100/50/33/25 multiple student offsets, \$5300 single student family size offset, and DI rates of 75% for married and 11%/13%/18%/25% if with dependents.

FIGURE 14
EXPANSION OF PELL GRANT ELIGIBILITY
FOR INDEPENDENT APPLICANTS

FIGURE 15

**CHANGE IN PELL GRANT BETWEEN 1987-88 AND 1988-89
FOR A SINGLE INDEPENDENT APPLICANT
AT A PUBLIC FOUR-YEAR COLLEGE**

For an unmarried independent applicant with a dependent, Pell Grants at a public four-year college will increase by \$100 between 1987-88 and 1988-89 from income levels through about \$8,000. Above that income, increases will be greater. At \$10,000 Pell Grants will increase by \$400. At \$14,000 they will increase by \$800. At \$18,000 they will increase by \$1,350. Increases will be greater than the \$100 increase to be experienced by zero SAIs for all income levels up through \$26,000 per year.

For married independents without other dependents, the increase in discretionary income assessment rates from 25% to 75% will reduce or eliminate many previously eligible Pell applicants. Only the lowest income eligible applicants will see increases. Up to about \$7,000 in income, Grants will increase by \$90 to \$100. However, above that level or the amount protected by the family size offset plus tax allowances, grants will decrease. At \$8,000 Grants will decrease by \$200. At \$10,000 they will decrease by \$1,100, and at \$11,000 Grants will decrease by \$1,150. In fact, whereas married independent applicants were eligible for Pell Grants up through about \$15,000 of income in 1987-88, they will be eligible for minimum awards only up to about \$10,000 in 1988-89.

If, however, the married independent Pell applicants have a dependent, the reduction in discretionary income assessment rates will actually expand the eligibility for grants in 1988-89. Up to about \$8,000 in family income Pell Grants will increase by \$90. At \$12,000 they will increase by \$600. By \$18,000 they will increase by \$1,250. The upper income limit for a minimum Pell Grant will increase from about \$16,000 in 1987-88 to about \$26,000 in 1988-89.

With the exception of the married independent applicants without dependents, the evidence again appears to justify the following conclusion: In the case of independent Pell applicants with lowest SAIs, some significant portion of the funds required to maintain the purchasing power of the Pell Grant relative to actual college attendance costs has been reallocated by Congress, first in 1978 and again in 1986, toward applicants with higher SAIs to increase their Pell eligibility. The exception, of course, is the substantially reduced Pell Grant eligibility for married independents without dependents who have incomes above the level protected by the family size offset and tax allowances.

With only one exception, changes to dependent and independent Pell applicant eligibility have been in the direction of expanded eligibility and Program cost. Under the restriction of limited Program funding, this expanded eligibility has been financed partly by lack of growth in the maximum Pell Grant provided for those with zero SAIs.

The changes made to the original Basic Educational Opportunity Grant Program by the Middle Income Student Assistance Act of 1978 and the 1986 Amendments have clearly and quite consistently shifted its focus. Congress has decided, for both dependent and independent Pell Grant applicants, to expand eligibility to additional classes of previously ineligible applicants while increasing grants to others previously eligible without funding adequate to match college attendance cost increases.

FOR A MARRIED INDEPENDENT APPLICANT, WITH ONE CHILD, ONE IN COLLEGE,
AT A PUBLIC FOUR-YEAR COLLEGE

Under the constraint of limited funding, these additions have been partially financed through lack of growth in the maximum Pell Grant for the lowest SAI applicants. Although the maximum Pell Grant is authorized for annual increases under the 1986 Amendments, available funding will be largely used to create or expand eligibility for applicants other than those from lowest family resource levels.
